WHAT THE DRONE SAW

WHAT NABHYA SAW

The field looks even. It isn't.

Nabhya turns photos from the camera drone you already own into crop vigour maps a farmer can read.

PILOT INVITATION FOR DRONE SERVICE COMPANIES · NABHYA.TECH

nabhya

ONE FIELD, THREE VIEWS

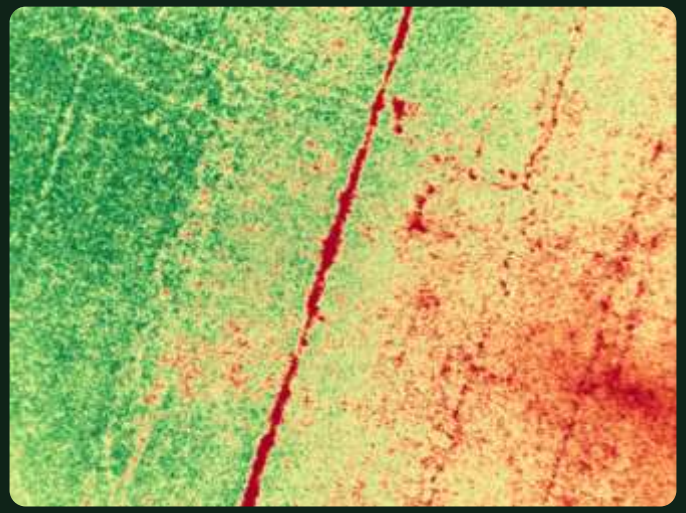

A ₹5–6 lakh camera saw this. So did a colour photo.

1 · COLOUR PHOTO

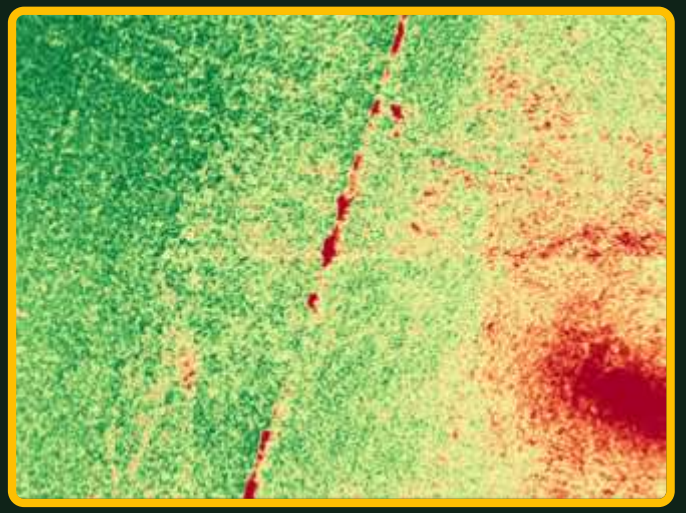

What an ordinary drone camera recorded.

2 · TRUE NDVI

What a multispectral camera measured.

3 · NABHYA

Worked out from photo 1 alone. Same bund, same low-vigour corner.

Rice, Mekong Delta, one flight. Each map is stretched to its own range. Data: Nguyen et al., Data in Brief 63 (2025). Camera price: Indian retail listings, 2026.

nabhya

THE PROBLEM YOU ALREADY KNOW

Every operator sells the same spray

₹300–700

per acre is the going rate for drone spraying in India. When every company offers the same flight, the farmer chooses on price.

And the whole field gets one dose, though the crop is never the same everywhere.

One flight path, one rate. The red and yellow patches get the same as the green.

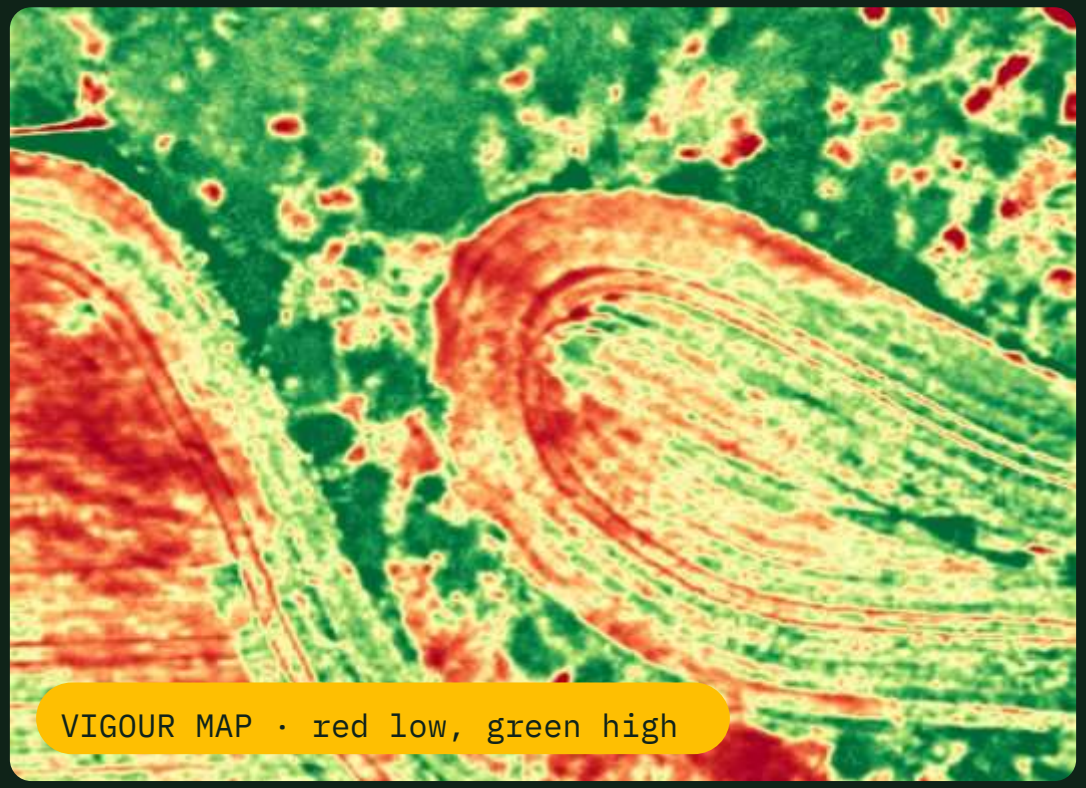

14,500 more spray drones are going to women's self-help groups under Namo Drone Didi. More drones, the same service.

Rate: 2026 guides to drone spraying in India (agrijob.in, kodainya.com). Drones: Namo Drone Didi guidelines, Ministry of Agriculture.

nabhya

WHAT COMES BACK FROM ONE FLIGHT

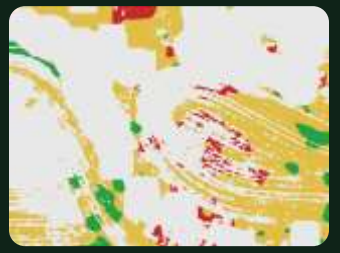

One flight, four layers

Your photo

Any colour camera drone. Nothing to add to it.

Scout-first zones

Red marks the patches to walk first, with the area of each.

What was set aside

Trees, water, shadow and roads are left out, and the report says so.

Nabhya output on a sample field from our test set.

nabhya

HOW FAST

25 seconds from upload to finished maps

Timed on a real rice photo through our live service on 29 Sep 2026. A whole field stitched from many photos takes minutes.

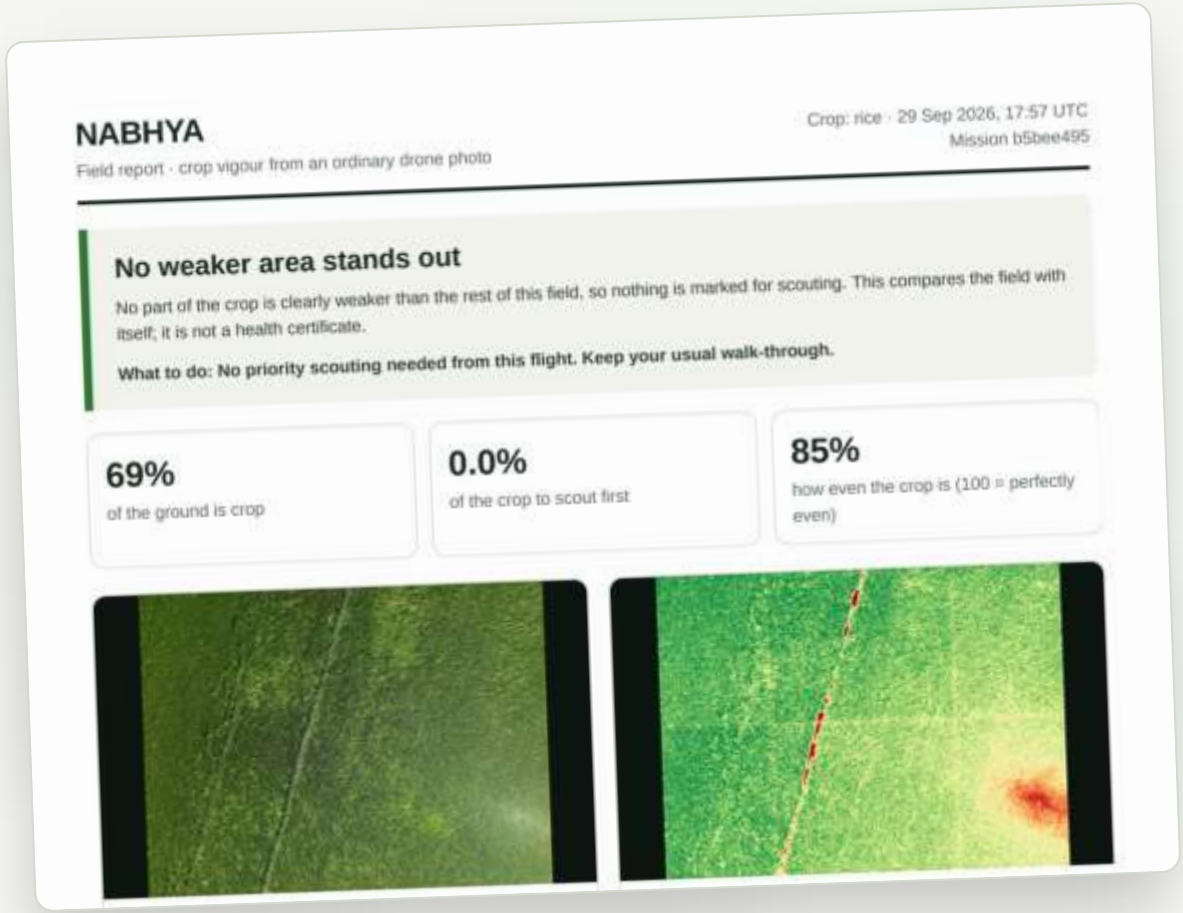

---

1 upload. A photo, or a folder of them.

4 map layers. Ready to open or download.

1 link. For the farmer, with no login.

nabhya

WHAT THE FARMER RECEIVES

One link with a plain answer

Opens on any phone

No app, no login. Forward it on WhatsApp.

Says where, not why

It points to the patches. The cause is confirmed on the ground.

Honest when all is well

This real report says no area stands out. It does not invent a problem.

nabhya

HOW IT FITS YOUR DAY

Three steps, no new equipment

1

Fly

A short mapping flight with any camera drone, camera pointing straight down.

2

Send

Share the photo folder with us. Teams with a developer can plug into our API.

3

Deliver

You get a report link. Forward it to the farmer under your own name.

No multispectral camera. No GIS software. No training course.

nabhya

EVERYTHING IN THE BOX

Live today, and what comes next

Vigour map
One fixed colour scale, so flights can be compared.

Scout-first zones
The weakest patches of crop, with the area of each.

Photo stitching
Up to 2,000 overlapping photos joined into one field map.

Farmer report
A permanent link and an email. Prints on A4.

Stated confidence
Every result carries a confidence level and plain warnings.

Clutter set aside
Trees, water, shadow and roads stay out of the numbers.

GIS-ready files
GeoTIFF of the stitched map for your own software.

One-call API
Send a photo, get the answer back in the same call.

COMING IN 2027

Spray-ready maps
Zone files a spray drone can follow, so the dose changes by zone.

Crop calibration
Tuning for each major crop.

Change maps
What moved between two flights.

nabhya

WHAT IT CAN EARN YOU

A second service on the same visit

[500] acres mapped in a month × **₹[30]** charged to the farmer per acre = **₹[15,000]** extra in a month

Stand out when you quote. You bring a map; the next operator brings only a tank.

A reason to come back. Map again after two weeks and show what changed.

A record of the job. A dated report for every field you fly.

Example only. The bracketed figures are yours to fill in; the pilot is how we find the real ones together.

nabhya

CLOSER TO HOME

First check on Indian fields

SATELLITE COLOUR

TRUE NDVI

NABHYA, COLOUR ONLY

0.97

match with true NDVI, rabi (17 Feb 2026)

0.96

kharif (10 Sep 2026). 1.0 is a perfect match.

What this does not prove. It is satellite, not drone, and our model learned from satellite images. It shows the model behaves on Indian cropland. Drone proof on Indian fields is what the pilot is for.

Greater Noida (Dankaur), UP. Contains modified Copernicus Sentinel data 2026; part of a 12.8 × 10.2 km area shown.

nabhya

HOW FAR TO TRUST IT

What is tested, and what is not yet

Tested

734 drone photos of rice with true multispectral readings. Nabhya matched them better than the best colour formula: 0.67 against 0.60.

Scout-first zones. About half the red area was truly in the weakest tenth of the crop. Chance is 10%.

Not yet

Indian fields by drone. That is what this pilot is for.

No diagnosis. It shows where to look. It does not name a pest, a disease or a missing nutrient.

nabhya

THE PILOT

Free for four weeks, on your own fields

You get

50 acres of maps and farmer reports, free.

Setup help and a direct line to the founder.

Your data stays yours. We delete it when you ask.

We ask

Fly 3 to 5 fields in a mapping grid.

Walk the red patches and tell us if the map was right.

Honest feedback. We quote no result without your OK.

No commitment to continue. After the pilot, plans start from ₹12 per stitched acre.

nabhya

THE FOUR WEEKS

From first flight to a decision

WEEK 1

Set up

A short call, a one-page sheet of flight settings, and your first field.

WEEK 2

Fly

Two to four more fields. We send each report back to you.

WEEK 3

Check

You and the farmer walk the red patches and compare them with the map.

WEEK 4

Decide

We review the results together. Continue on a plan, or stop at no cost.

Red to green. The four colours in our logo are our vigour scale.

NEXT STEP

Give us one field this week

We send the flight settings today. You fly it on your next visit. The first report comes back to you before the farmer asks.
